Clinical Notes**Addendum Note****El Kouzi, Ahmad, MD at 12/11/2024 1600**

Added by: EL KOUZI, AHMAD on: 12/12/2024 08:10 AM

Modules accepted: Orders

Electronically signed by El Kouzi, Ahmad, MD at 12/12/2024 8:10 AM

Progress Notes**El Kouzi, Ahmad, MD at 12/11/2024 1600****HPI:****Patient ID:** Kalin Jenkins is a 26 year old female.**HPI**

Kalin follows up for management of her migraines. I am seeing her on an urgent basis today. Her migraines have been stable on the regimen of Topamax 50 mg twice daily and Nurtec as needed for abortive therapy. She recently reached the Topamax 50 mg twice daily as she was on a titrating regimen, titration was slow as she was experiencing numbness and tingling in her fingers bilaterally.

She told me that she was rear-ended on 12/09 while she was driving her car and had a whiplash movement of her neck. Experienced severe pain on the back of her head and since then her headache has been worse. She describes a different type of headache than her typical migraines, mostly muffled and whooshing sounds in her ears, stabbing pain in her ears and dull aching pain around her temples. Pain is severe and is affecting her sleep. It is hard for her to move her neck to look up and side to side movement can be difficult.

12/11/2024 - Office Visit in Endeavor Health Medical Group, 127th Street, Plainfield (continued)
Clinical Notes (continued)

She did not lose consciousness due to the accident but has been feeling foggy and difficulty concentrating and maintaining her attention. She feels weakness in both upper extremities and she has dropped few things while holding them as she told me. Her gait has been affected as she has been bumping into things as she is trying to walk normally. Denies falls. Her coordination is affected, she feels she overshoots or undershoot to reach objects at times and she may accidentally drop them and her fine motor skills are not the same.

She was evaluated in the emergency department and a CT scan of her neck was obtained and did not reveal any fractures. She was eventually discharged home.

She became emotional during the interview today as she was telling me she was satisfied with the management of her migraines and was finally able to get it under control with Topamax and Nurtec but now the accident exacerbated her headaches again

Allergies: Allergies^[1]
PHYSICAL EXAM:
Physical Exam

General Appearance: Well nourished, well developed, no apparent distress.

HEENT: Normocephalic and atraumatic. Normal sclera.

Neck: tenderness over occipital area bilaterally

Mental Status Exam: Patient is awake, alert and oriented to person, place and time with normal memory, fund of knowledge, attention/concentration and language.

Cranial Nerves: fundoscopic exam is normal

II: Visual fields: normal to confrontation test

III: Pupils: equal, round, reactive to light, NO APD

III,IV,VI: Normal EOM. Saccades

V: Facial sensation: intact

VII: Facial strength: Normal

VIII: Hearing: intact

IX: Palate elevates symmetrically

XI: Shoulder shrug: symmetric

XII: Tongue protrudes in midline

Motor Exam: Normal tone. Strength is 5 out of 5 in proximal and distal muscles of upper and lower extremities. She had giveaway weakness during the motor exam.

DTR: 2+ and symmetric.

Sensory: Normal sensation to superficial touch in all extremities

Coordination: Normal finger-nose-finger test

12/11/2024 - Office Visit in Endeavor Health Medical Group, 127th Street, Plainfield (continued)**Clinical Notes (continued)**

Gait: Stands up and walk unassisted. No shuffling no freezing of gait. Normal arm swings bilaterally. Normal stride. Normal postural reflexes

TESTS/IMAGING:

CT neck , no fractures

ASSESSMENT/PLAN:**Encounter Diagnoses**

Name	Primary?
• Post concussive syndrome	Yes
• Cervicogenic headache	

Post concussive symptoms:

She was rear-ended while driving her car on 12/9/2024 and has been experiencing severe headaches mostly in her occipital area but also bitemporal. On exam she was extremely tender on palpation of her occipital areas bilaterally. Neurological exam was normal otherwise.

She has been experiencing problems with her attention and sleep. This could be consistent with postconcussive symptoms. I will get MRI brain and MRI cervical spine.

I given a dose of Toradol 30 mg intramuscular in her left deltoid muscle during the visit today. This is to alleviate the cervical musculoskeletal pain. If she experiences relief with Toradol I will put her on p.o. Toradol for 48 hours.

I made no changes on the Nurtec or Topamax dosing for now. She had reached 50 mg of Topamax twice daily only 2 days ago

Thank you for allowing us to participate in your patient's care.

Meds This Visit:**Requested Prescriptions**

Informed Consent: You may require an injection of contrast for your test. While adverse reactions are rare, the following information will help educate you and help generate questions.

- Although FDA approved, MRI contrast does have potential side effects that you should be made aware.
- Administration of MRI contrast may increase the risk of a rare but serious disease, Nephrogenic Systemic

12/11/2024 - Office Visit in Endeavor Health Medical Group, 127th Street, Plainfield (continued)

Imaging (continued)

Fibrosis (NSF), in people with severe kidney failure.

- The most common side effects of IV MRI contrast agents are dizziness, nausea, and headache.
- In very rare cases, serious side effects can occur and include cardiac failure, arrhythmia, and myocardial infarction (heart attack).

The above information is correct to the best of my knowledge. I have read and understand the contents of this form and have had the opportunity to ask questions regarding this form, IV contrast, and the MRI procedure.
